

01 Communique Files Patent Application for its Remote PC Wake-Up Technology

TORONTO, ON – October 26, 2005 – 01 Communique Laboratory Inc. (TSX: ONE – www.01com.com), a leading remote access solutions provider, today announced it has filed a patent application for its remote Personal Computer (PC) wake-up technology. This technology provides for remote-booting of a turned-off desktop PC, which allows a PC that is “shutdown” at the office to be remotely started. With the ability to “wake-up” a PC, this technology eliminates the need for leaving your desktop PC turned-on while away, in order to be able to access it from a remote location.

In a report on the Remote Access Services Market dated February 2005, Stephen Drake, an analyst with IDC, commented that, “This inherent need to keep a PC on and running to access files also raises a number of security concerns for organizations, which include access issues...” The new technology addresses these concerns and is of particular importance to corporations with extremely stringent security policies, requiring that unattended PCs be “shut down” or put into “sleep/stand-by” mode when an employee leaves the office. It is also of importance to environmentally conscious organizations that are concerned about energy consumption of PCs left powered on for extended periods of time.

“This innovative technology provides a solution for how employees remotely access PC’s that are turned-off,” said Andrew Cheung President and CEO of 01 Communique. “In the past, companies have struggled to find the balance between adhering to corporate policies and allowing its employees to be productive from anywhere. As a result, mobile productivity has often taken a second place to concerns surrounding security on the Internet and the rising costs of energy. With this technology we can alleviate companies’ concerns and allow users of our technology to “shutdown” their PCs, and at the same time, provide them with remote access when they need it.”

About the Patent Application

The patent application relates to a system, method and computer program for remotely sending a digital signal(s) to a computer. The result is a solution for sending a digital signal(s) to computers connected to a local computer network from a remote computer that is external to the local computer network.

About 01 Communique

Established in 1992, 01 Communique is an innovative force in the development and delivery of remote access services and integrated communications software. As the digital and wireless economy evolves, 01 continues to provide cost effective and reliable solutions that give businesses anytime, anywhere access to information stored on a desktop PC. 01 Communique has built an extensive market for its remote access, messaging and communications solutions with its I’m InTouch remote access solutions and legacy product line COMMUNICATE!, through the cultivation of solid distribution channels and marketing partnerships.
